

Liquid Foam is a monophonic analog groovebox that revolves around a dual sequencer designed to encourage complex pattern exploration. It can generate anything from straightforward 4/4 loops to ever-changing byzantine synth lines, off-key tantrums and organic percussive phrases.

Power: 45mA at +12V, 9mA at -12V

Width: 32 hp **Max depth:** 20 mm

GENERAL CONSIDERATIONS:

All the jacks inside a white circle are inputs, the other ones are outputs. Every input has its own dedicated comparator with a threshold level set at 3.7V so it is able to accept any type of signal and internally converts it to gates of various length. The trig and EG outputs will fire anytime a control voltage signal is patched to any of the A, B, C inputs.
